*$n\_TOF$  Run and Analysis Coordinator*

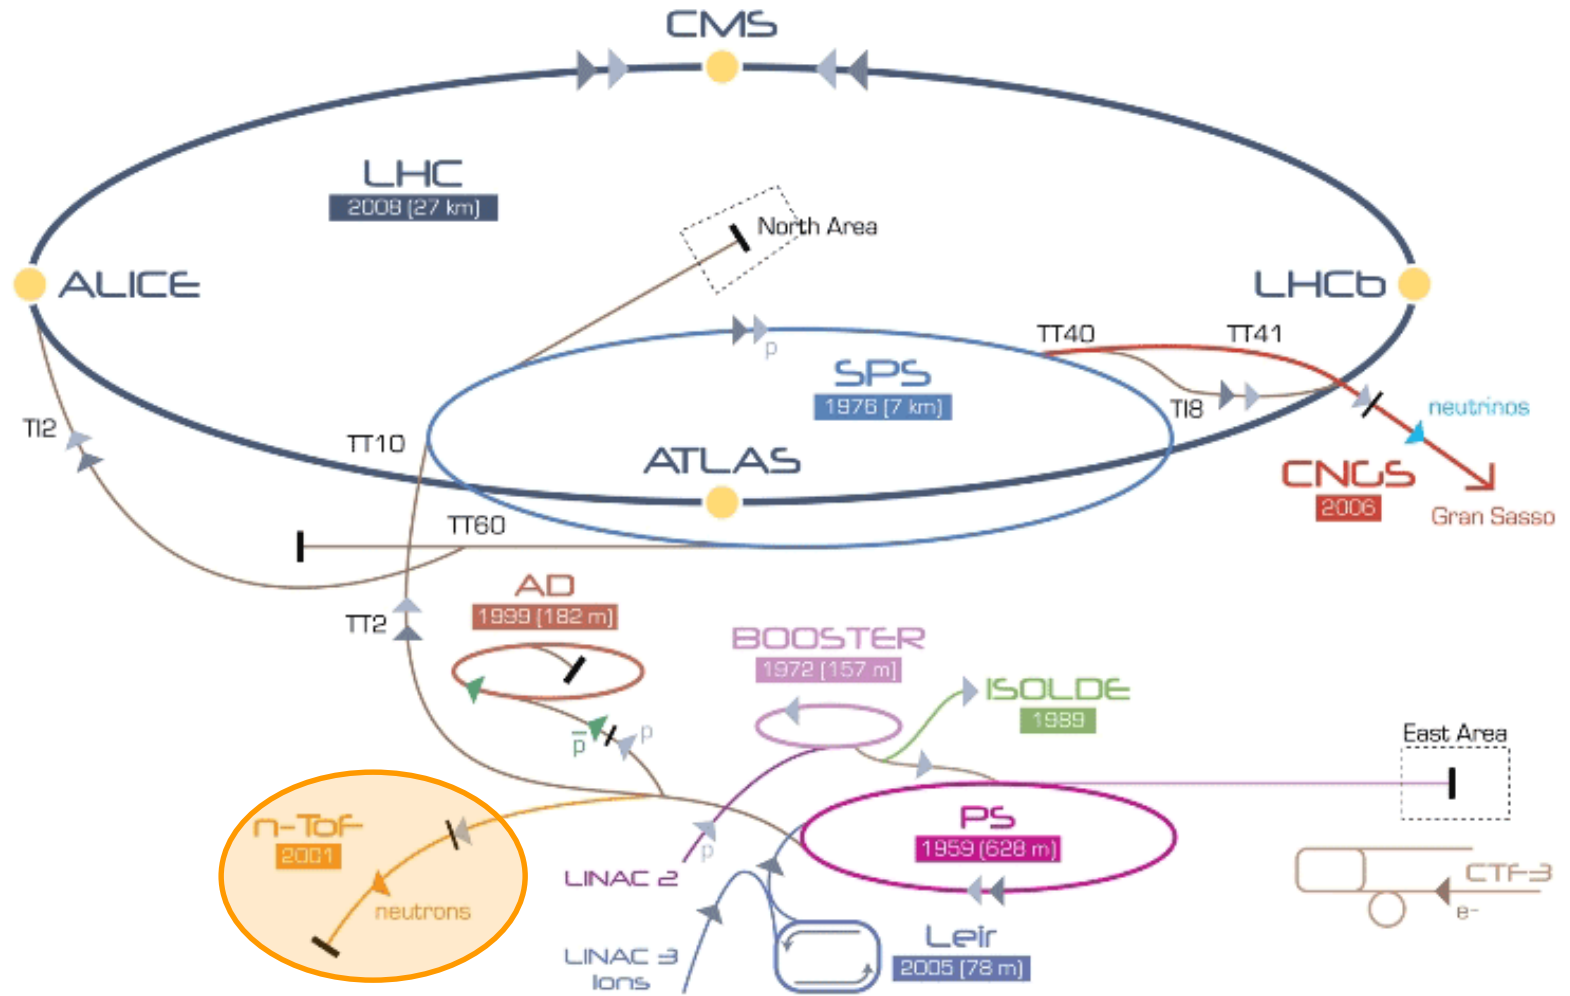

---

“In the early days of the Manhattan Project when an unknown cross section was needed, the procedure for obtaining a value for it was simple. You went and asked Fermi. Invariably he would refuse to hazard a guess. The next step, so the story goes, was to recite slowly a long string of numbers, and if one of the numbers produced a gleam in Fermi's eye - that was the value to use!”

H. Goldstein (talk at Atomenergie, Sweden, September 1953)

+Energy

# Neutrons and production of nuclear energy (& radioactive waste)

New nuclear reactor concepts:

- a) Gen-IV: Fast reactors that can operate with fuels including U, Pu and MA
- b) ADS (Accelerator Driven Systems): dedicated nuclear waste burners

New fuels composition and different neutron energy regime call for new reactions, whose cross sections are not known with the required accuracy.

# Neutrons and production of isotopes in stars: The s-process

Solar system elemental abundances

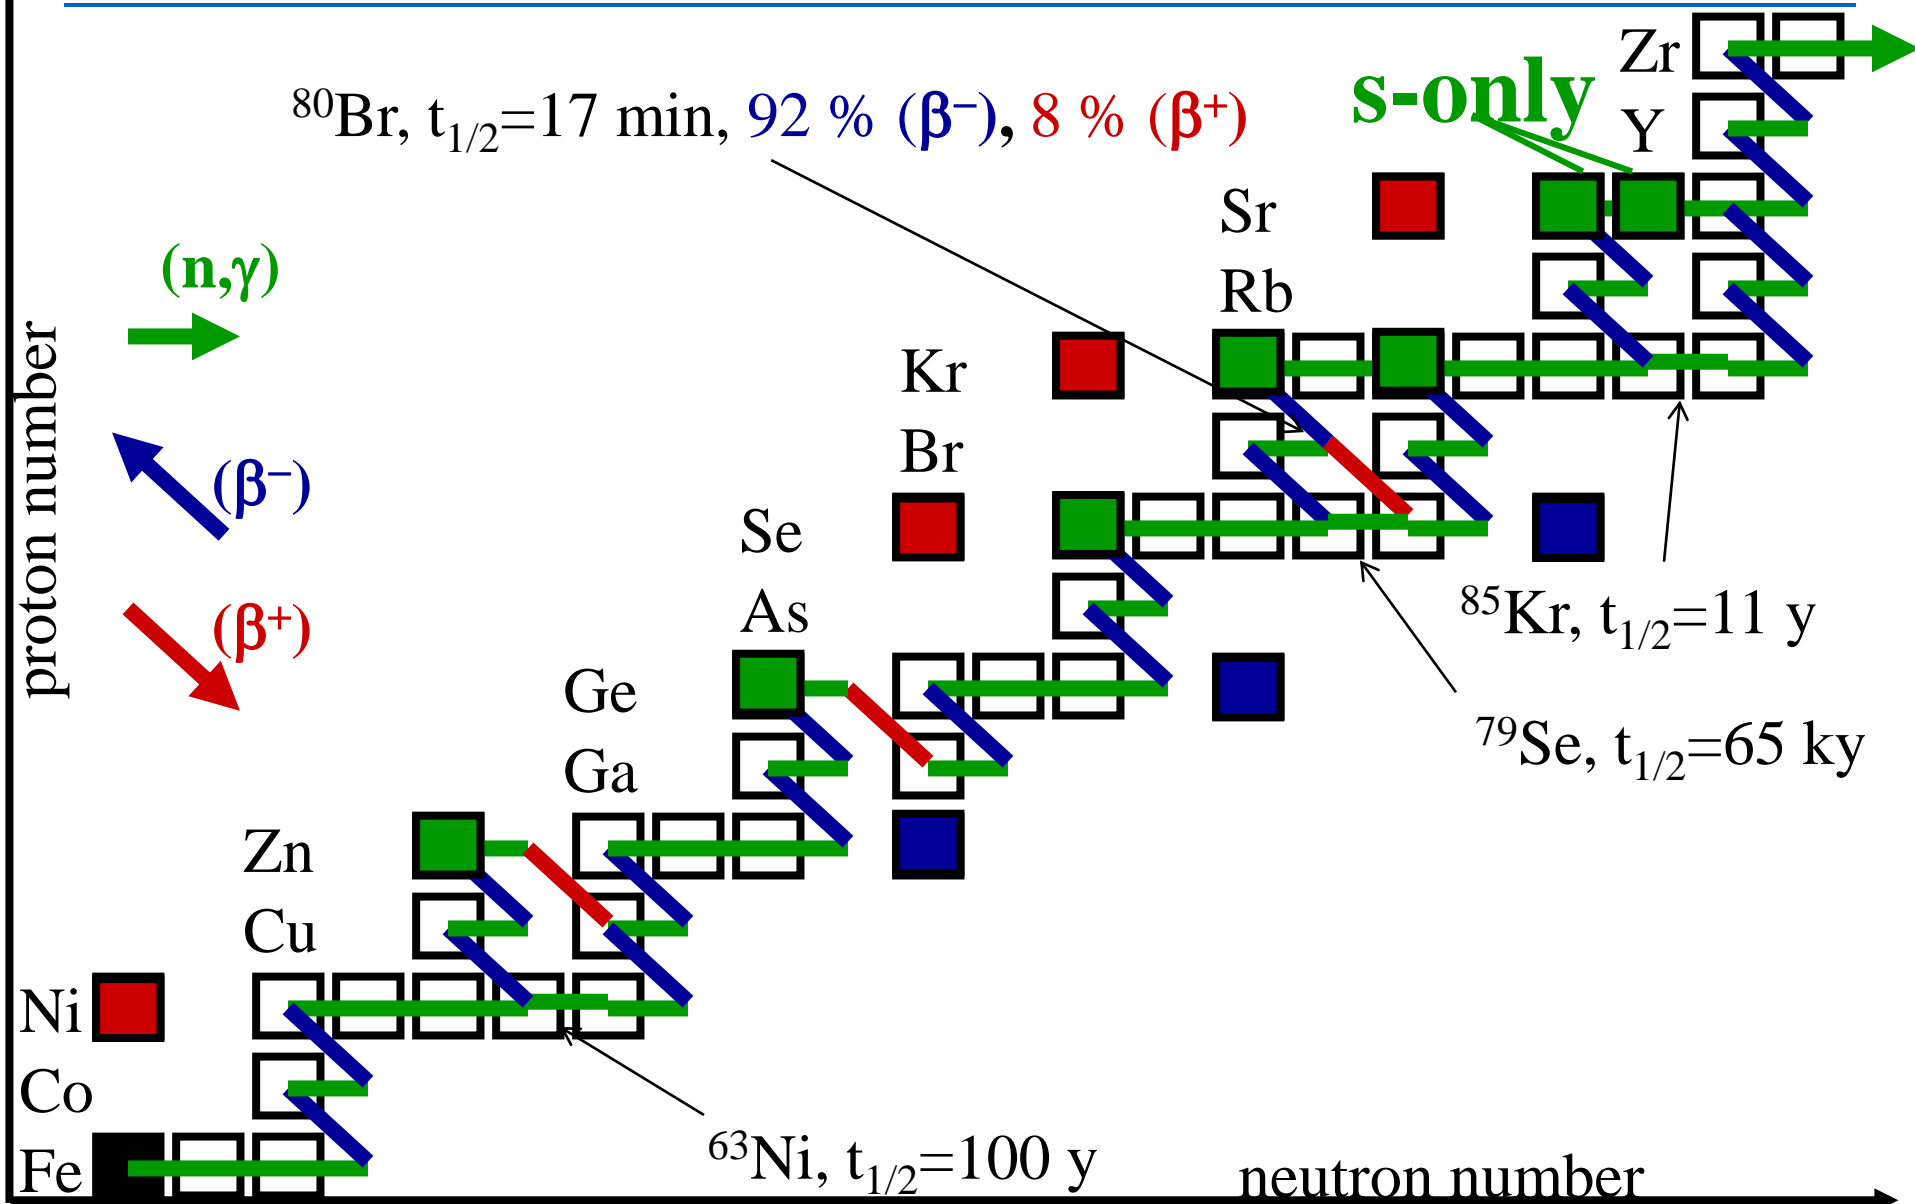

Chemical elements beyond Iron are synthesized via neutron capture reactions in stars:

- ~ ½ by the s-process (red giants)
- ~ ½ by the r-process (explosive)

# Neutrons and production of isotopes in stars: The s-process

# Neutrons and production of isotopes in stars: The s-process

In the weak s-process region the abundances of isotopes from Fe to Zr are highly affected by the knowledge of the cross section of every single isotopes:

Conclusions can be drawn only when ALL cross sections are known!

n\_TOF campaign to measure all the available isotopes of Fe & Ni:

54,56,57,58Fe // 58,60,61,62,63,64Ni

ISOLDE Seminar at CERN, January 23<sup>rd</sup> 2013

# Measurement of neutron-induced cross sections: ToF technique

neutron time-of-flight  
experiment

Time-of-Flight to  $E_n$  relation (non-rel.):

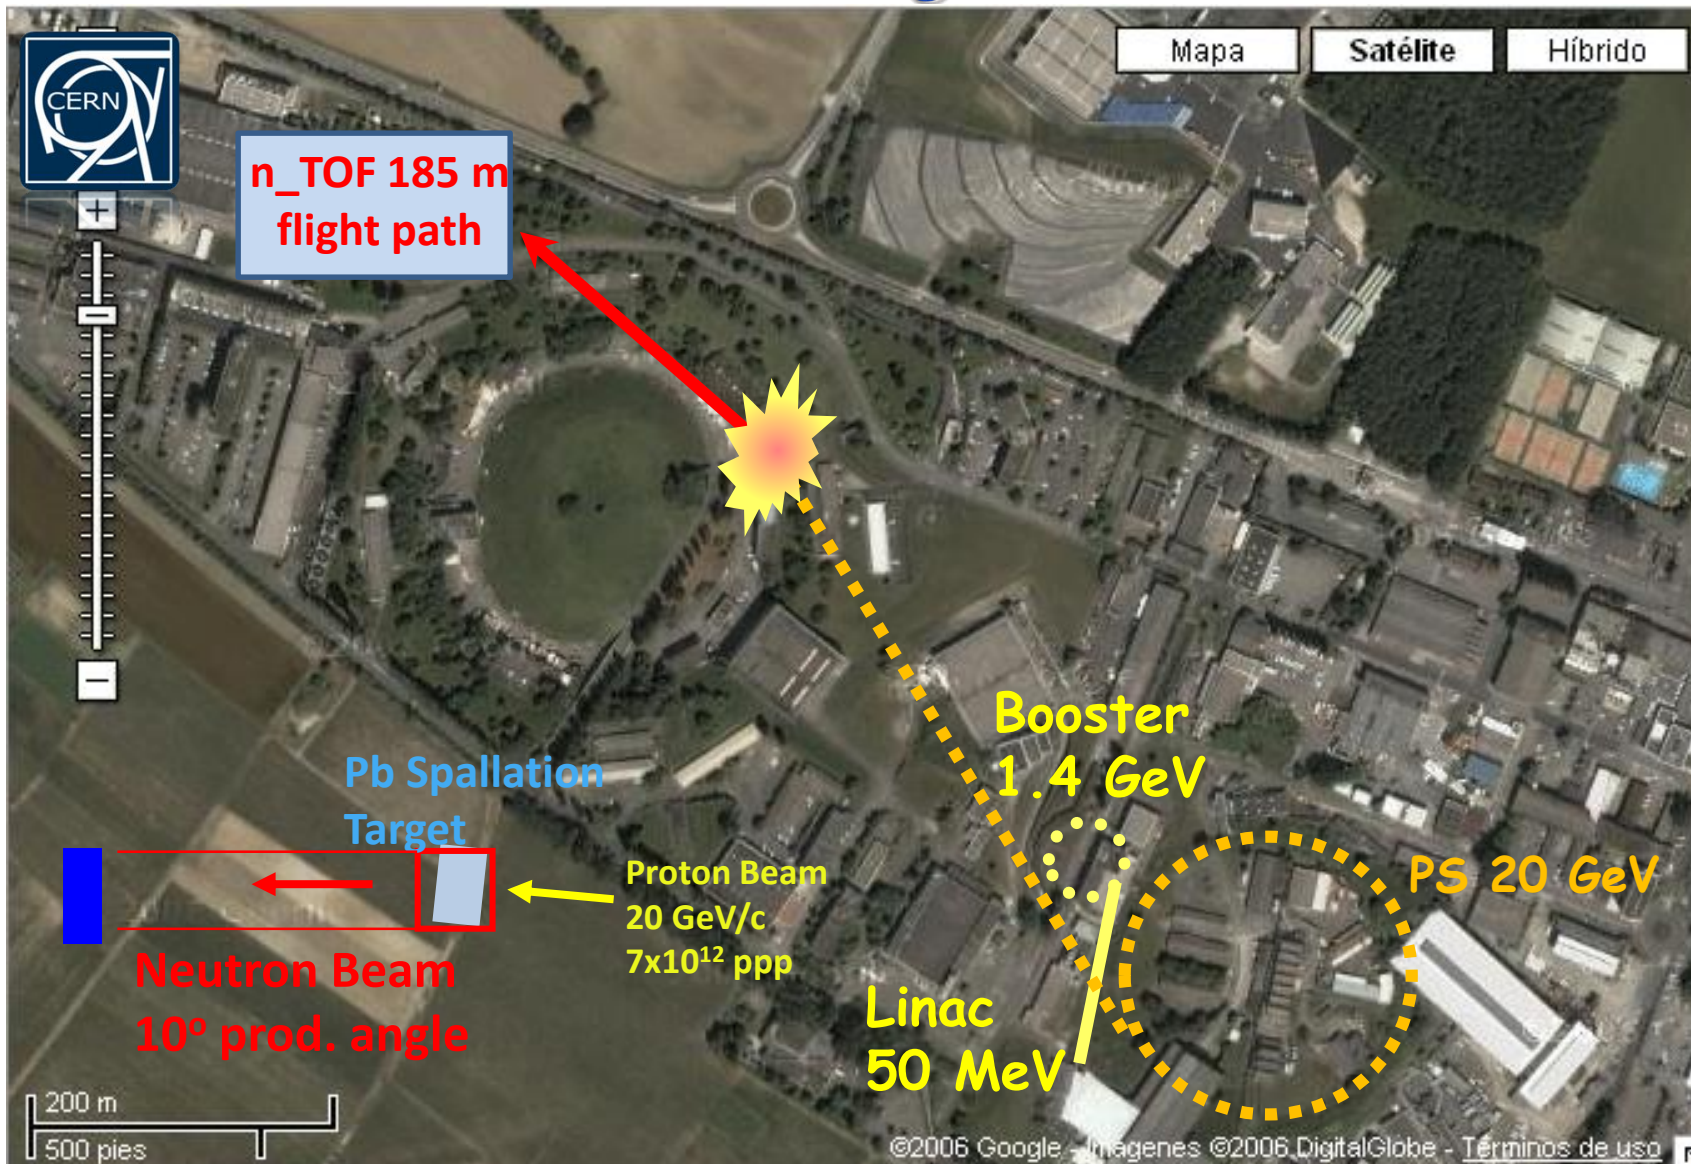

$$ToF \propto \frac{L}{\sqrt{E_n}}$$

Measuring the neutron cross sections requires:

- A facility providing a neutron beam (The n\_TOF facility).
- A detection system for counting the reactions
- A highly pure sample.
- A theoretical framework to express the cross sections ( $R'$ - matrix formalism).

# The n\_TOF Facility at CERN: a Google™ view

*"Physics with neutron beams at the CERN n\_TOF facility"*  
ISOLDE Seminar at CERN, January 23<sup>rd</sup> 2013

# The n\_TOF lead spallation target (from 2008 onwards)

1. Approx. 400 FAST (MeV-GeV) neutrons/proton (20 GeV/c) are generated @target
2. They are slowed-down (MODERATED) in 5 cm of water+<sup>10</sup>B-water: meV to GeV
3. A fraction reaches the experimental hall after 185 meters of vacuum

ToF (GeV) ~ 630 ns

ToF (MeV) ~ 13  $\mu$ s

ToF (keV) ~ 420  $\mu$ s

ToF (eV) ~ 13 ms

ToF (10 meV) ~ 133 ms

ISOLDE Seminar at CERN, January 23<sup>rd</sup> 2013*

# The n\_TOF Facility in pictures

**Work Sector Type A:  
use of non-encapsulated radioactive samples allowed since 2010!!!**

# Main characteristics of the n\_TOF neutron beam

## NEUTRON FLUX

$0,6 \cdot 10^6$  neutrons/pulse (capture mode)

$12 \cdot 10^6$  neutrons/pulse (fission mode)

## BEAM PROFILE

## ENERGY RESOLUTION

$E_n$ (eV)	$\Delta E_n/E_n$
1	$4.3 \cdot 10^{-4}$
10	$4.3 \cdot 10^{-4}$
$10^2$	$4.3 \cdot 10^{-4}$
$10^3$	$7.5 \cdot 10^{-4}$
$10^4$	$1.7 \cdot 10^{-3}$
$10^5$	$5.4 \cdot 10^{-3}$
$10^6$	$2.8 \cdot 10^{-3}$

# Main characteristics of the n\_TOF neutron beam

- Proton **intensity**  $8 \times 10^{12}$  p/pulse
- Proton beam **momentum** 20 GeV/c
- Proton **pulse width** 6 ns (rms)
- high **instantaneous n flux**  $10^5$  n/cm<sup>2</sup>/pulse
- wide energy **spectrum**  $25 \text{ meV} < E_n < 1 \text{ GeV}$
- low **repetition rate**  $< 0.25$  Hz
- good energy **resolution**  $\Delta E/E = 10^{-4}$

Neutron beam + state-of-the-art detectors and acquisition systems make n\_TOF **UNIQUE** for:

- measuring **radioactive isotopes**, in particular **actinides**
- identifying and studying **resonances** (at energies higher than before)
- extending **energy range** for fission (up to 1 GeV !).

# Measurements at n\_TOF

*"Physics with neutron beams at the CERN n\_TOF facility"*  
*ISOLDE Seminar at CERN, January 23<sup>rd</sup> 2013*

# Detection of neutron induced fission reactions

The most easy and clean method for measuring fission reactions is based in the **detection of at least one of the fission fragments**: ionization chambers!

# Detection of neutron induced fission reactions

The main problem in fission measurements is the **background** due to  **$\alpha$ -decay**.  
At n\_TOF the background minimized by the very **high instantaneous** neutron flux.

## Parallel Plate Avalanche Counters (PPAC)

- Fission fragments detected **in coincidence**
- Very good rejection of  $\alpha$ -background
- Provide info on angular distr. of fission fragments

## Micromegas (MGAS) detectors

- low-noise, high-gain, radiation-hard detector

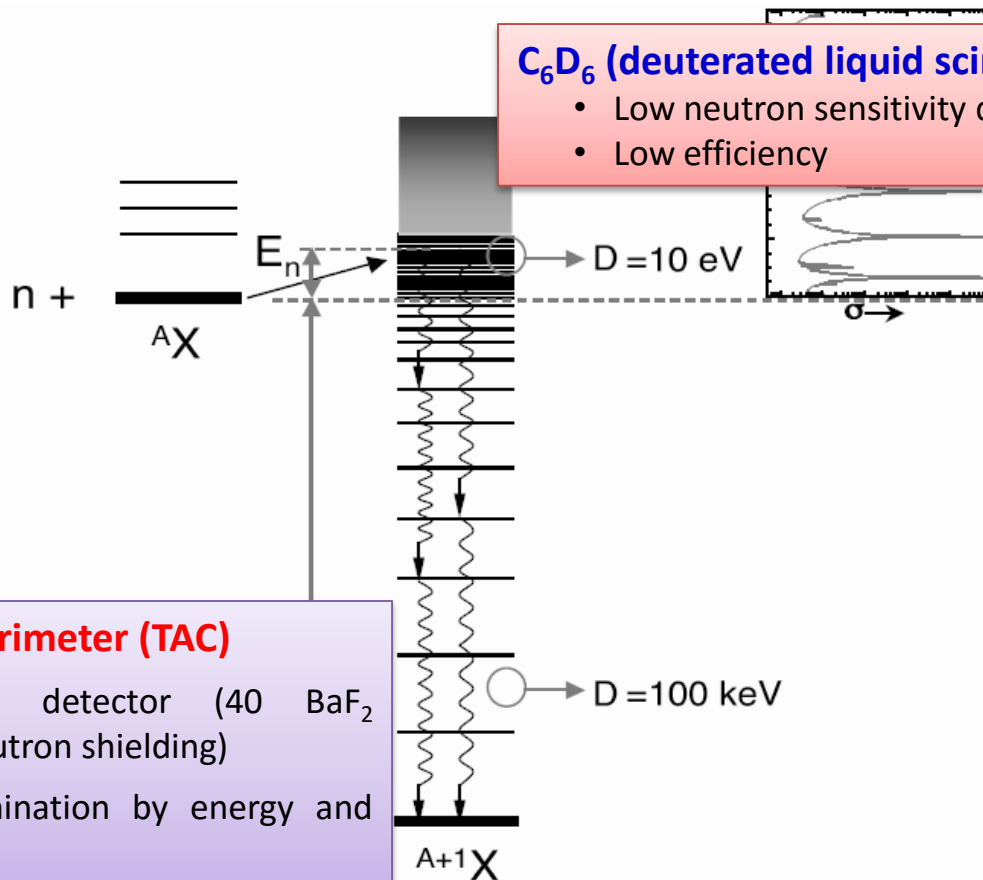

# Detection of neutron capture reactions

Neutron capture reactions are measured by:

**detecting the  $\gamma$ -rays emitted in the de-excitation process.**

At n\_TOF two different systems are available to minimize different types of background

# Detection of (n, $\alpha$ ) reactions

The main problem in (n, $\alpha$ ) measurements is the background from other reactions in the sample, or in the detectors (gas recoils, etc.)

## Micromegas chamber (MGAS)

- low-noise, high-gain
- Several samples in parallel

## Diamond (pCVD or sCVD)

- Background reactions only above 1 MeV
- Very fast response
- Particle discrimination (if sCVD or charge collection distance > 300 μm)

# The neutron beam dump as neutron irradiation testing facility

## Measurement of fast neutrons with a triple GEM

S. Puddu (CERN/RP) and F. Murtas (LNF-IFNN, Italy)

A. Tsinganis PhD work

The criticality of current and fast future reactors must be known within 0.3-0.5% for operation/safety.

Sensitive mainly to the  $^{235}\text{U}(n,\gamma)$  below 2.25 keV (RRR)

## The n\_TOF Total Absorption Calorimeter

- $4\pi$  geometry (high tot. absorption effic.)
- 40 BaF<sub>2</sub> crystals (segmentation)
- Good energy resolution (back. discrimin.)
- Used extensively for (n, $\gamma$ ) on actinides

## The n\_TOF MicroMegs fission detector

- Two gas regions: conversion & amplification
- High gain and low noise
- Possibility for several samples in parallel.
- Used extensively for (n,f) and (n, $\alpha$ )

# Validation of simultaneous measurement of capture and fission reactions at n\_TOF

# Information from (n, $\gamma$ ) cascades with the n\_TOF/TAC

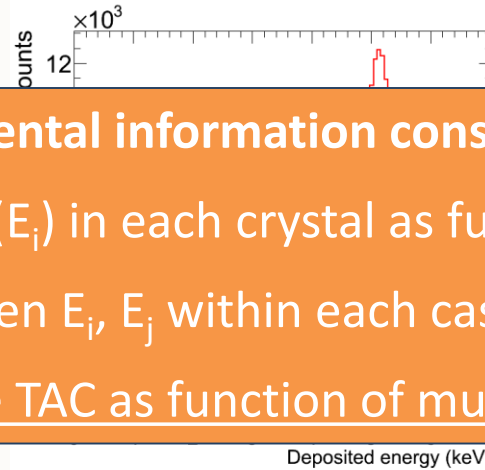

The Total Absorption Calorimeter (TAC) :  
 $4\pi$  detector made of 40 BaF2 crystals

Neutron energy

Deposited energy

Multiplicity

Additional experimental information consists in:

- Energy deposited ( $E_i$ ) in each crystal as function of multiplicity ( $m_{cr}$ )
- Correlation between  $E_i$ ,  $E_j$  within each cascade
- Total energy in the TAC as function of multiplicity

# Validation of simultaneous measurement of capture and fission reactions at n\_TOF

TACFTMG energy,  $2 < \text{mult} < 8$ ,  $E_n$  within resonances

TACFTMG Multiplicity ( $E_{\text{sum}} > 3 \text{ MeV}$ )

# Validation of simultaneous measurement of capture and fission reactions at n\_TOF

- Selected for the cover of the EPJ-A journal of March 2012  
 - Most downloaded paper in EPJ-A website in March-May 2012  
 - Selected as highlight in Europhysics News (Vol. 43, No 3)

# THE FUTURE: A VERTICAL NEUTRON BEAM LINE AT 20 M

*“Physics with neutron beams at the CERN n\_TOF facility”  
ISOLDE Seminar at CERN, January 23<sup>rd</sup> 2013*

# n\_TOF Phase 3: vertical flight path (20 m)

## EAR-2

Flight-path length : ~20 m  
at 90° respect to p-beam direction  
**expected neutron flux enhancement**  
drastic reduction of the  $t_0$  flash

# The future: n\_TOF vertical flight path at 20 m

# The future: n\_TOF vertical flight path at 20 m

---

## Experiments in EAR-2 can be performed :

- i) on very small samples (reduce activity or used samples with limited availability)
- ii) on isotopes with very small cross sections (where signal/background ratio is crucial)
- iii) in much shorter time (some meas. can be eventually repeated to reduce systematic  $\Delta$ )
- iv) on neutron-induced cross sections at high energies ( $E_n > 10-100$  MeV), which are not possible in the existing EAR-1, will benefit if the  $\gamma$ -flash is reduced.
- v) possibility to bring a 'basket' with electronics component down to only 1.5 m from the target ( $10^{10}$  neutrons/pulse): irradiation facility (e.g. SEE)

## Main activities during the LS1

### n\_TOF@CERN

- ✓ Civil engineering work for building the bunker
- ✓ Optimize the design of the collimator and beam dump
- ✓ Making the bunker a Work Sector Type A

### n\_TOF Collaboration

- ✓ Design new detectors optimized for the EAR-2 (very high counting rates)
- ✓ Upgrade the existing DAQ
- ✓ Find/prepare samples of exotic isotopes

# Conclusions and perspectives

**n\_TOF@CERN is a world leading in the field of neutron induced reaction measurements**

## Operating since 2001 and upgraded in 2008

- ❑ Nucleosynthesis, Advanced Reactors and Basic Physics
- ❑ Mainly, but not only,  $(n,\gamma)$ ,  $(n,f)$  and  $(n,\alpha)$
- ❑ 40 capture measurements to date
- ❑ 15 fission measurements to date
- ❑ 16 PhD students at present

## New neutron beam line to be ready in 2014

- ❑ 20 meters flight path
- ❑ 25 times higher neutron flux
- ❑ 250 times higher instantaneous intensity

### *The n\_TOF team @CERN*

E. Berthoumieux, M. Calviani, E. Chiaveri,  
I. Bergstrom, C. Guerrero, A. Tsinganis, V.  
Vlachoudis and C. Weiss

*“Physics with neutron beams at the CERN n\_TOF facility”  
ISOLDE Seminar at CERN, January 23<sup>rd</sup> 2013*

# Basic nuclear physics measurements at n\_TOF

## Angular distribution of fission fragments:

Driven by the **dynamics of the fission process**

One can observe effects from 1<sup>st</sup>, 2<sup>nd</sup>, ... chances

Use of position sensitive PPAC tilted 45°.

## Spin assignments near $S_n$

Observe diff. in  $\gamma$ -ray decay from resonances of different spin

Fine tune/test of **level density models**

Use of 'segmented' TAC for  $\gamma$  cascades

# (some) Neutron production mechanisms

## Neutron 'radioactive sources':

## (quasi)Mono-energetic sources (depending on Q-value, $E_p$ and angle)

e.g. NFS@GANIL, ENEA-FNG

## Electron driven source:

## Spallation sources:
